Rapid cytological diagnosis of papilloma of the bladder by using urine supernatant and direct smear. A procedure was developed for rapid cytological diagnosis of papilloma of the bladder. A urine sample was centrifuged after centrifugation for 10 min at 800 g to remove cells, then supernatant was expelled to make a smear, after which the centrifuge tube was opened and smears were fixed and stained by the Papanicolaou method. The presence of papilloma cells was determined by examining the smear by light microscopy. Of 71 urine samples, 13 (18.3%) samples of the patients with positive cytology showed papilloma cells. All the papilloma cells were eliminated after the centrifugation. The false-negative rate of the procedure was 5.0%. It was concluded that this method is very useful to rapid detection of papilloma of the bladder.This invention relates to a steam sterilizing system and more particularly to a steam sterilizing system which heats the contained sterilizing medium to a temperature in excess of about 10.degree.
